Lipid droplets as the major site of fatty acid desaturation in rat brain microsomes. The effects of the phospholipid inhibitors, diisopropyl fluorophosphate (DFP) and arachidonyltrifluoromethyl ketone (ATK) on desaturases (E2 and E1) and the amount of lipid droplets (LD) in rat brain microsomes were studied. In the presence of either inhibitor, LD were present in the ER. In the absence of inhibitors, desaturases were present in the LD fraction, but no LD were present. Under all conditions, the microsomal cholesterol-to-phospholipid molar ratio was 1:2. Therefore, the differences in the amount of LD in the presence or absence of inhibitors were due to differences in the amount of phospholipid. From these data, it was concluded that LD were the major site of fatty acid desaturation in the rat brain. ADAMTS-8 (TACE) is a secreted proteinase that is secreted by breast tumor
