Corel Draw X4 is designed for beginners, and there is a good tutorial in the program for beginners to follow. This program is not as easy to use for beginners as it is for pro users, so it can be a struggle for beginners to get even basic image editing done. A versatile all-in-one program, or painting program, is the program Paint Shop Pro X8, available from Adobe Systems (www.adobe.com). PhotoShop Elements 8 is another alternative that includes tools for working with graphics, as well as advanced features. The following sections show you how to launch and use both of these programs to work with photographs. As you know by now, with digital photography, the image that results is a raster image. This type of image can be edited or altered using layers, masks, and transparency. That's important to know before you get started with Photoshop because these features are the foundation of what you do in Photoshop. In this section, we show you how to lay out your image and put it into a default layer in Photoshop, or load your image into a layer in a pre-existing file. Setting up your workspace As you read in Chapter 4, every image is composed of layers and masks, and the layers are composed of pixels and grouped in layers. Each layer is given an opacity so that the viewer can determine if something is showing through or buried beneath other layers. In the chapters in this part of the book, each layer is explained in depth. Before you begin laying out your layers and masks, make sure that you have created a new document in your project folder. We always use a new document to make sure that the new layer is not over an existing document. Making the first layer and activating masks The first steps of working with Photoshop are to put the image into a file and set up a new layer that can contain your edits. The following steps outline those steps: 1. Load your image into a new file. In this example, our image is a JPEG file (see Figure 7-1) named flagracing2.jpg. You can load an image from your hard drive or a DVD. 2. Display your image by clicking the View button on the Layers panel (or selecting View⇒Show/Hide Layers). To see the layers in your image, expand the Layers panel on the workspace window (see Figure 7-2).

This post is an intro to Photoshop. It will show the absolute basics of the software. The goal is not to provide deep insights about Photoshop's tools but to give an overview of the basics and its features. I will only cover the program's interface and tools. For a deeper dive into the program, check out this video: Top Tools Here are the basic tools that you will use the most. You can use any of them for any given task. 🌟 The Toolbar This toolbar contains all the most frequently used shortcuts and functions. The toolbar has been divided horizontally to see icons. The tool icons can be toggled on and off by clicking the buttons at the end of each row. Pressing F3 will toggle on the Toolbar and put it on a new location for quick access (click below the image to see a bigger view). The commands are in the order in which I like them to appear for easy access. Below are the shortcuts to each button. Access Photoshop's Toolbar Access the Toolbar The Toolbar is useful for: Browsing through the hundreds of tools Opening and closing the tool palette Locking/unlocking the tool palette Accessing the Toolbar from anywhere Command Shortcuts View ↓ Zoom in Zoom out View the preview View on monitor View in slideshow The left mouse button (on Windows and macOS) or Magic Wand The right mouse button (on Windows and macOS) Click the item Toggle locked on Toggle unlocked Access the Toolbar from anywhere Select the Toolbar You can add the Toolbar to any side or corner of the workspace. This means that you can access it easily. To do so, go to the Window Menu and then click on the Sidebar Menu (Windows) or Dock Menu (macOS). Under Toolbars you will find the Toolbar menu item. Choose any side or corner of the workspace as the location of the Toolbar. You can also drag and drop the Toolbar from the Menu Bar to any side or corner of

the workspace. You can access the Toolbar from anywhere by pressing F3. If you press the F3 key, the Toolbar will become locked. It is now locked and you can move it 05a79cecff

Q: How to change IP of docker container from inside container I am running Docker in my MAC, and I am starting two containers (each with its own IP) using docker-machine run -d -P... command. I was trying to connect them using the following command: # Put all the containers in the same subnet docker exec -it container_1_ip_1 ping google.com I know that this is possible if I run the container with --net=host, but I am not sure whether I can do it if I run the containers with docker-machine start and docker-machine run -d -P. I know that it is not possible to change the IP of a container, but I need to know how to connect the containers if they are on different docker hosts. I also tried using --ip=host but it did not work. NOTE: I have to connect the containers from inside the containers, thus there is no way to use a gateway outside the containers. A: I know that this is possible if I run the container with --net=host, but I am not sure whether I can do it if I run the containers with docker-machine start and docker-machine run -d -P. No, you can't do this. The IP address is determined at the time the container is created (which is in some way deterministic). A container can resolve its hostname using DNS, but the IP address of a container is determined at the time the container is created. Additionally, the Docker networking model that uses IP addresses instead of hostnames also uses the same IP address for containers within the same Docker host. That host also must have a fixed IP address, not a dynamic IP address assigned by DHCP or other method of dynamic IP allocation. Q: Passing command line arguments using array in shell script I am trying to pass an array containing the arguments I would like to run the script. The problem is, some of the arguments are not being passed. I am trying to do this using a file called test.sh. Here is the code I am using: #!/bin/sh #\${@}="ping www.google.com" #\${@}="3" #\${@}="6" #\${@}="8" #\${@}="10" #\${@}="11" #\${@}="12" #\${@}="
